

The study of the Aluthge transform  $T_e$  was introduced and studied by Aluthge in his study of  $p$ -hyponormal operators in 1990. Several researchers have since studied various properties of the transform for a single operator  $T$ . For instance, quite a lot has been researched on the numerical range of  $T_e$  of an operator  $T$ . In contrast to this, nothing is known about the joint numerical range of Aluthge transform  $T_e$  of an  $m$ -tuple operator  $T = (T_1, \dots, T_m)$ . The main reason for this limitation is that the notion of Aluthge transform is still a new area of study. The focus of this paper is on the study of the properties of the joint numerical range of Aluthge transform for an  $m$ -tuple operator  $T = (T_1, \dots, T_m)$ . Among other results, we show that the joint approximate point spectrum of  $T_e$  is contained in the closure of the joint numerical range of  $T_e$ . This study is therefore helpful in the development of the research on numerical ranges and Aluthge transform.
